

Synthetic Extension Table Layout Check

Author 1

These tables contain deliberately synthetic test values. They are a layout check, not measured forecasting results.

System 10 is adjacent to original Colorado system 4; it is not an independent climate. All fifteen outputs and the same observed daylight rows are retained. Receipt times are simulated; the target is recorded AC.

TABLE II
EXTENSION RECOVERY-MINUS-AVAILABILITY CONTRASTS AND BLOCK-LENGTH SENSITIVITY.

Phase	Block days	$10^3 \Delta \text{NWIS}$ [95% CI]	Pairs
0–6 h	7	1.234 [-2.000, 3.000]	500
0–6 h	14	1.234 [-2.000, 3.000]	500
0–6 h	28	1.234 [–, –]	500
6–24 h	7	1.234 [-2.000, 3.000]	500
6–24 h	14	1.234 [-2.000, 3.000]	500
6–24 h	28	1.234 [–, –]	500

Both recovery windows and all three declared block lengths are reported together. Calendar blocks keep common-weather replays together. Overlapping forecast-target pairs are not independent observations; this is a fixed-system extension after original-result exposure.

TABLE III
DECLARED EXTENSION ALIGNMENT, RECEIPT AND INFORMATION-ACCESS CHECKS.

Joint-gradual case	$10^3 \Delta \text{NWIS}$ [95% CI]
Joint gradual	1.234 [-2.000, 3.000]
Minute-end alignment	1.234 [-2.000, 3.000]
Five-minute receipt margin	1.234 [-2.000, 3.000]
Privileged labels (diagnostic)	1.234 [-2.000, 3.000]

Seven-day intervals shown; 14/28-day versions remain in the source CSV. All contrasts are recovery minus availability. Privileged labels deliberately change information access and are excluded from deployable rankings.
